

Installation Guide for CronRunner Module by WitSolTech

Please Note: This guide is designed to be beginner-friendly for users of various languages.

Step 1: Unpacking the Extension

- Start by extracting the files from the CronRunner extension ZIP folder provided by WitSolTech on your computer. Think of it as opening a package.

Step 2: Uploading to Your Website

- Use an FTP, SFTP, or SSH client to connect to your website's source folder. This is like connecting your computer to your website.
- Upload all the files and folders from the CronRunner extension package into the main folder of your Magento website. Imagine this as adding new items to your website's collection.
- Make sure to choose the "Merge" mode while uploading. It's like adding new books to your library without replacing the old ones. Most FTP/SFTP software does this automatically.
- If you're using a Mac computer, we recommend using Transmit for this step.
- If you are installing multiple extensions from WitSolTech, don't worry if you see the same files in different packages. You can replace them because these files are used by all our extensions. It's like using the same key to open multiple doors.

Step 3: Connecting with SSH

- Connect to your Magento directory using SSH. This is a more technical step, similar to opening a secret door.

Step 4: Running Commands

- Now, you'll need to run three commands one after the other. Think of this like typing instructions into your computer:

- Type: ``php bin/magento setup:upgrade`` and press Enter.
- Type: ``php bin/magento setup:static-content:deploy`` and press Enter.
- Type: ``php bin/magento setup:di:compile`` and press Enter.

Extra Help:

- For more detailed information on configuring the CronRunner Module by WitSolTech, you can visit our knowledge base. Think of it as a library where you can find answers to your questions:
